

BIO-INNOVATIONS

Dutch based Agri-food (tech) Start-up in biological control.

Our products

Our insects are packed in pupae form in cardboard tubes and shipped to the customer. The packaging describes the conditions under which our insects develop optimally.

Our gall midge, the *Aphidoletes aphidimyza*, is a real aphid killer. In pupal form they look harmless, but the larvae can do something!

Our hoverfly, the *Episyrphus balteatus*, is also known as 'pyjama hoverfly'. That sounds very innocent, but she lays her eggs between the aphids and the larva is a voracious predator that sucks her prey dry!

The *Aphidius ervi* is known as a true seeker. If it finds an aphid, it will parasitize it by laying its eggs in the abdomen of the aphid. When these eggs hatch, the aphid is slowly eaten from the inside! What remains is a swollen brown mummy.
